git web-based hosting

- **Git** is a [distributed revision control](#) system with an emphasis on speed, data integrity, and support for distributed, non-linear workflows. [Wikipedia]

« Social coding »

The screenshot displays a GitHub repository interface. On the left, a code diff is visible with line numbers 177 to 183. The code includes a private static method that returns an instance of a File object, with a catch block for IOException and a log statement. The line 180 is highlighted in red. To the right of the code, a 'Watchers' section lists three users: Philippe Charles (Belgium), Thomas Witthohn (Joined on May 28, 2012), and Rytis Bagdziunas (Université catholique de Louv...). Below this, Martins Liberts (CSB) is also listed. The bottom section features a 'Write' tab and a 'Preview' tab. The 'Write' tab is active, showing a text area for leaving a comment. A message 'This is a required field' is displayed below the text area. At the bottom right of the comment section, there is a green button labeled 'Comment on this commit'.

Calendar adjusted series as target for SA benchmarking #6

Open palatej opened this issue 29 days ago · 0 comments

palatej commented 29 days ago

Collaborator

Following the SA guidelines, the benchmarking of the SA series should use the calendar adjusted series as target. For the moment the default is the original series. It should be changed.

Pull request

- Main steps
 - Create the feature in a dedicated branch in a local repository
 - Push the branch to a public repository (on Github)
 - Create a pull request (on Github)
 - Review of the code, discussions, modifications by the other developers
 - The project maintainer merges the feature into the official repository and closes the pull request.
- Remarks:
 - “Social control” (everything is public)
 - Final decision belongs to the owner of the project

Wiki

- Technical documentation on the use of the libraries

The screenshot shows a web browser displaying the GitHub Wiki page for the 'Algorithmic modules' in the 'jdemetra-core' repository. The page is edited by Jean Palate, with the last revision on Feb 3. The main content is a chart titled 'The main topics handled by the algorithmic library of jdemetra-core (jtstoolkit.jar) are presented in the following chart:'. The chart is a grid of colored boxes representing different topics: Basic data handling, Matrix computation, Complex, polynomial, Linear filters, Function optimization, Basic statistics, Utilities..., Basic econometrics, Arima modelling, Seasonal adjustment, Arima, Ucarima, State space framework, Time series, calendars, regression variables..., Tramo, RegArima, Structural models..., X11, Seats, Benchmarking, temporal disaggregation, and VAR, Dynamic factor model. On the right side, there is a 'Pages' sidebar with a list of links: Overview, Basic concepts (DataBlock, Matrix, Time series), Algorithms (Seasonal adjustment, Tramo-Seats, Outliers detection). At the bottom right, there is a 'Clone this wiki locally' section with a URL and a 'Clone in Desktop' button.

Algorithmic modules

Jean Palate edited this page on Feb 3 · 2 revisions

The main topics handled by the algorithmic library of jdemetra-core (jtstoolkit.jar) are presented in the following chart:

Basic data handling	Basic econometrics		
Matrix computation	Arima modelling	Tramo	
Complex, polynomial		RegArima	Benchmarking, temporal disaggregation
Linear filters	Seasonal adjustment	Structural models...	
Function optimization		X11	
Basic statistics	Arima, Ucarima	Seats	VAR, Dynamic factor model
Utilities...	State space framework		
Time series, calendars, regression variables...			

Pages

- Overview
- Basic concepts
 - DataBlock
 - Matrix
 - Time series
- Algorithms
 - Seasonal adjustment
 - Tramo-Seats
 - Outliers detection

Final remarks

- Powerful tool
 - For distributed revision control
 - For collaborative development
- Mainly designed for developers!
 - Complex tool (git)
 - Focus on code
- Wiki, issue tracking and follow up
 - You could (should) contribute.
- Migration to gitlab in the future ???
